Mohamed Abdullahi

DevOps Engineer

PROFILE

DevOps Engineer building and automating AWS cloud infrastructure with Terraform, Docker and Kubernetes. Hands-on across CI/CD, infrastructure as code, cloud security and monitoring, with a focus on delivering secure, scalable and reliable applications.

SKILLS

AWS — EC2, S3, VPC, IAM, Route 53, ECS | **Networking** — DNS, DHCP, TCP/IP, Routing, Switching, HTTP/HTTPS | **Git** | **Terraform** | **Linux** | **CI/CD** — GitHub Actions, Jenkins | **Scripting** — Bash, Python, Go | **Containers** — Kubernetes, Docker, Argo CD, Helm | **Monitoring** — Prometheus, Grafana

PROFESSIONAL EXPERIENCE

DevOps Engineer, *CoderCo* 07/2025 – Present

- Designed least-privilege IAM roles and policies, enforcing role-based access across platform workloads to strengthen AWS security.
- Introduced multi-stage Docker builds and image optimisation, cutting production image sizes by up to **97%** and improving deployment efficiency.
- Secured CI/CD pipelines by integrating GitHub Actions with AWS OIDC federation, eliminating long-lived cloud credentials from automated deployments.
- Built reusable Terraform modules to automate AWS provisioning, making environments consistent, maintainable and repeatable.
- Deployed containerised microservices on Amazon ECS Fargate behind an Application Load Balancer, improving scalability, workload isolation and resilience.
- Cut networking costs by approximately **30%** by adding VPC Endpoints for private connectivity between AWS services.
- Replaced the deprecated in-tree EBS provisioner with the AWS EBS CSI Driver and EKS Pod Identity, enabling dynamic persistent volume provisioning.
- Automated Kubernetes deployments with Argo CD GitOps, giving consistent, declarative and version-controlled releases.
- Established centralised monitoring with Prometheus, Grafana and CloudWatch, giving visibility into cluster health, application performance and resource utilisation.
- Integrated pre-commit hooks and shift-left security controls into CI/CD pipelines, so **100%** of infrastructure code and container images were validated automatically before deployment.
- Protected internet-facing applications with AWS WAF, ACM and Route 53, securing traffic through HTTPS and Layer 7 request filtering.
- Decoupled application services with Amazon SQS asynchronous messaging, improving scalability and fault tolerance.

PROJECTS

AWS URL Shortener Platform GitHub ↗ 06/2026 – 07/2026

- Designed and deployed a cloud-native URL shortener on Amazon ECS Fargate, running containerised API, worker, dashboard and frontend services behind an Application Load Balancer.
- Built reusable Terraform modules provisioning VPC, ECS, RDS PostgreSQL, ElastiCache Redis, Amazon SQS, Route 53 and WAF.
- Implemented Blue/Green deployments on ECS with canary traffic shifting, enabling zero-downtime releases backed by automated health checks and rollback.
- Secured CI/CD with GitHub Actions, OIDC federation and matrix builds, publishing multiple service images in parallel without long-lived cloud credentials.
- Embedded security and observability with Trivy, TFLint, Gitleaks and CloudWatch, validating infrastructure automatically and improving operational visibility.

GitOps Kubernetes Platform on AWS EKS GitHub ↗ 04/2026 – 05/2026

- Architected and deployed a production-grade GitOps platform on AWS EKS, using Terraform to provision networking, IAM and platform infrastructure across a multi-AZ architecture.
- Implemented GitOps with ArgoCD and the App-of-Apps pattern, managing platform components and Kubernetes workloads declaratively from Git.
- Built keyless CI/CD pipelines in GitHub Actions using OIDC federation, Trivy container scanning and Checkov Terraform analysis.
- Designed private subnet networking with IRSA, automated Route 53 DNS reconciliation and fully automated TLS through cert-manager and Let's Encrypt.
- Integrated Prometheus and Grafana through kube-prometheus-stack for visibility into cluster health, ingress traffic and workloads.
- Implemented automated teardown workflows that clean up Kubernetes-created AWS resources before Terraform destroy.

AWS ECS Monitoring and Deployment System GitHub ↗ Docker, Terraform, CI/CD 03/2026 – 04/2026

- Built and deployed a containerised application on Amazon ECS Fargate with Terraform, provisioning a VPC, private subnets, NAT Gateway, ECS services and an Application Load Balancer across multiple Availability Zones.
- Designed GitHub Actions CI/CD pipelines using OIDC federation for short-lived AWS authentication, enabling secure end-to-end deployments without long-lived credentials.
- Applied Docker multi-stage builds and image optimisation, reducing container image size by **97%** and improving deployment efficiency and startup performance.
- Configured HTTPS through ACM and Route 53, with Application Load Balancer health checks and rolling ECS deployments for reliable, stable releases.

CERTIFICATES

AWS Certified Solutions Architect, Associate — *In preparation*

EDUCATION

BSc Computer Science, Aston University — *Present*

A Levels, Sir George Monoux Sixth Form — *Biology, Psychology & English literature*
